

# Video Tag Portal

Anudeep Potlapally and Travis Rous

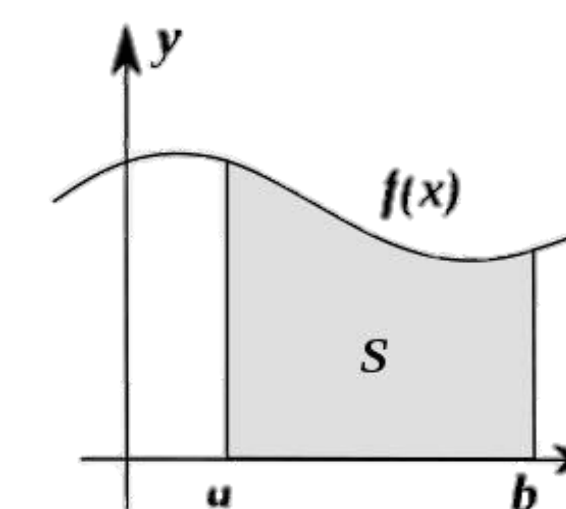

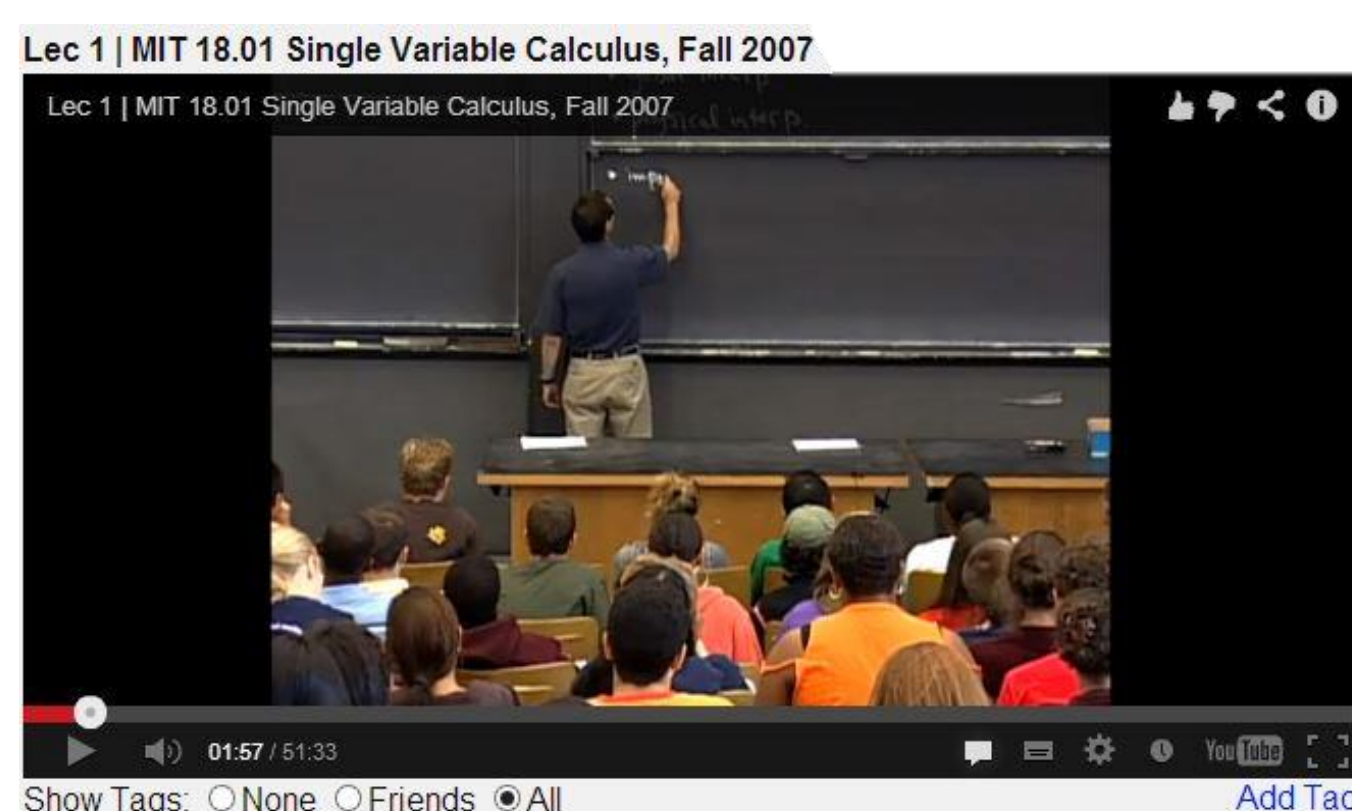

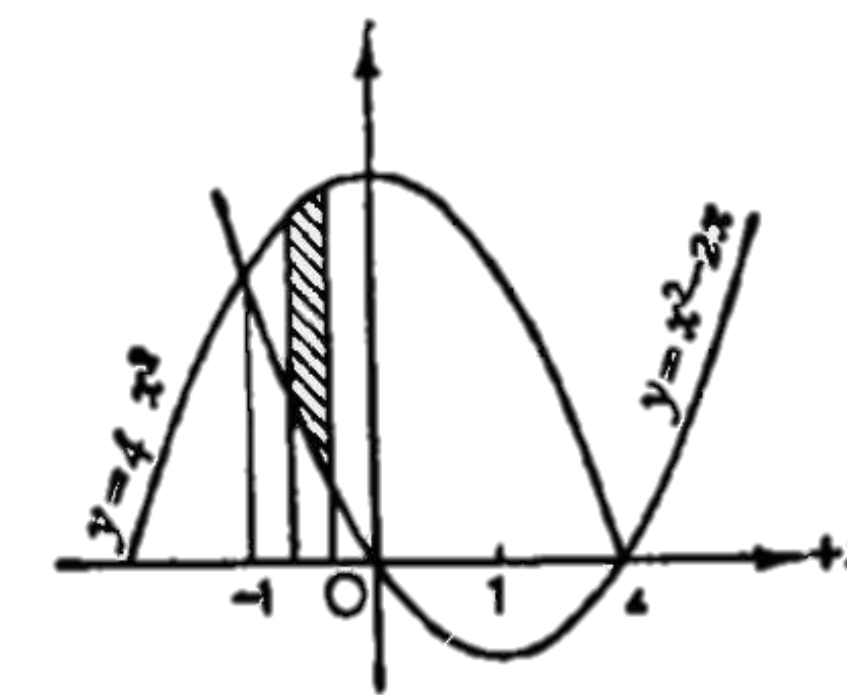

## Project Overview

This application is one where the users are allowed to add “that something” that is missing from a video of their choosing and share it with the world. For example adding pictures to an online lecture.

## Features

- Plays videos from YouTube and Vimeo
- Able to upload videos from the site to YouTube
- Allow you to see the friends that are also using the application.
- Able to add tags at any point in the video
- Available tags:
  - Comments
  - Images
  - Hyperlinks
  - Maps
- Tag Filters
  - See everyone's tags or just your friend's
- Search videos to add your own tags or just to watch.

- User defined tags appear as the video plays.

## Origination

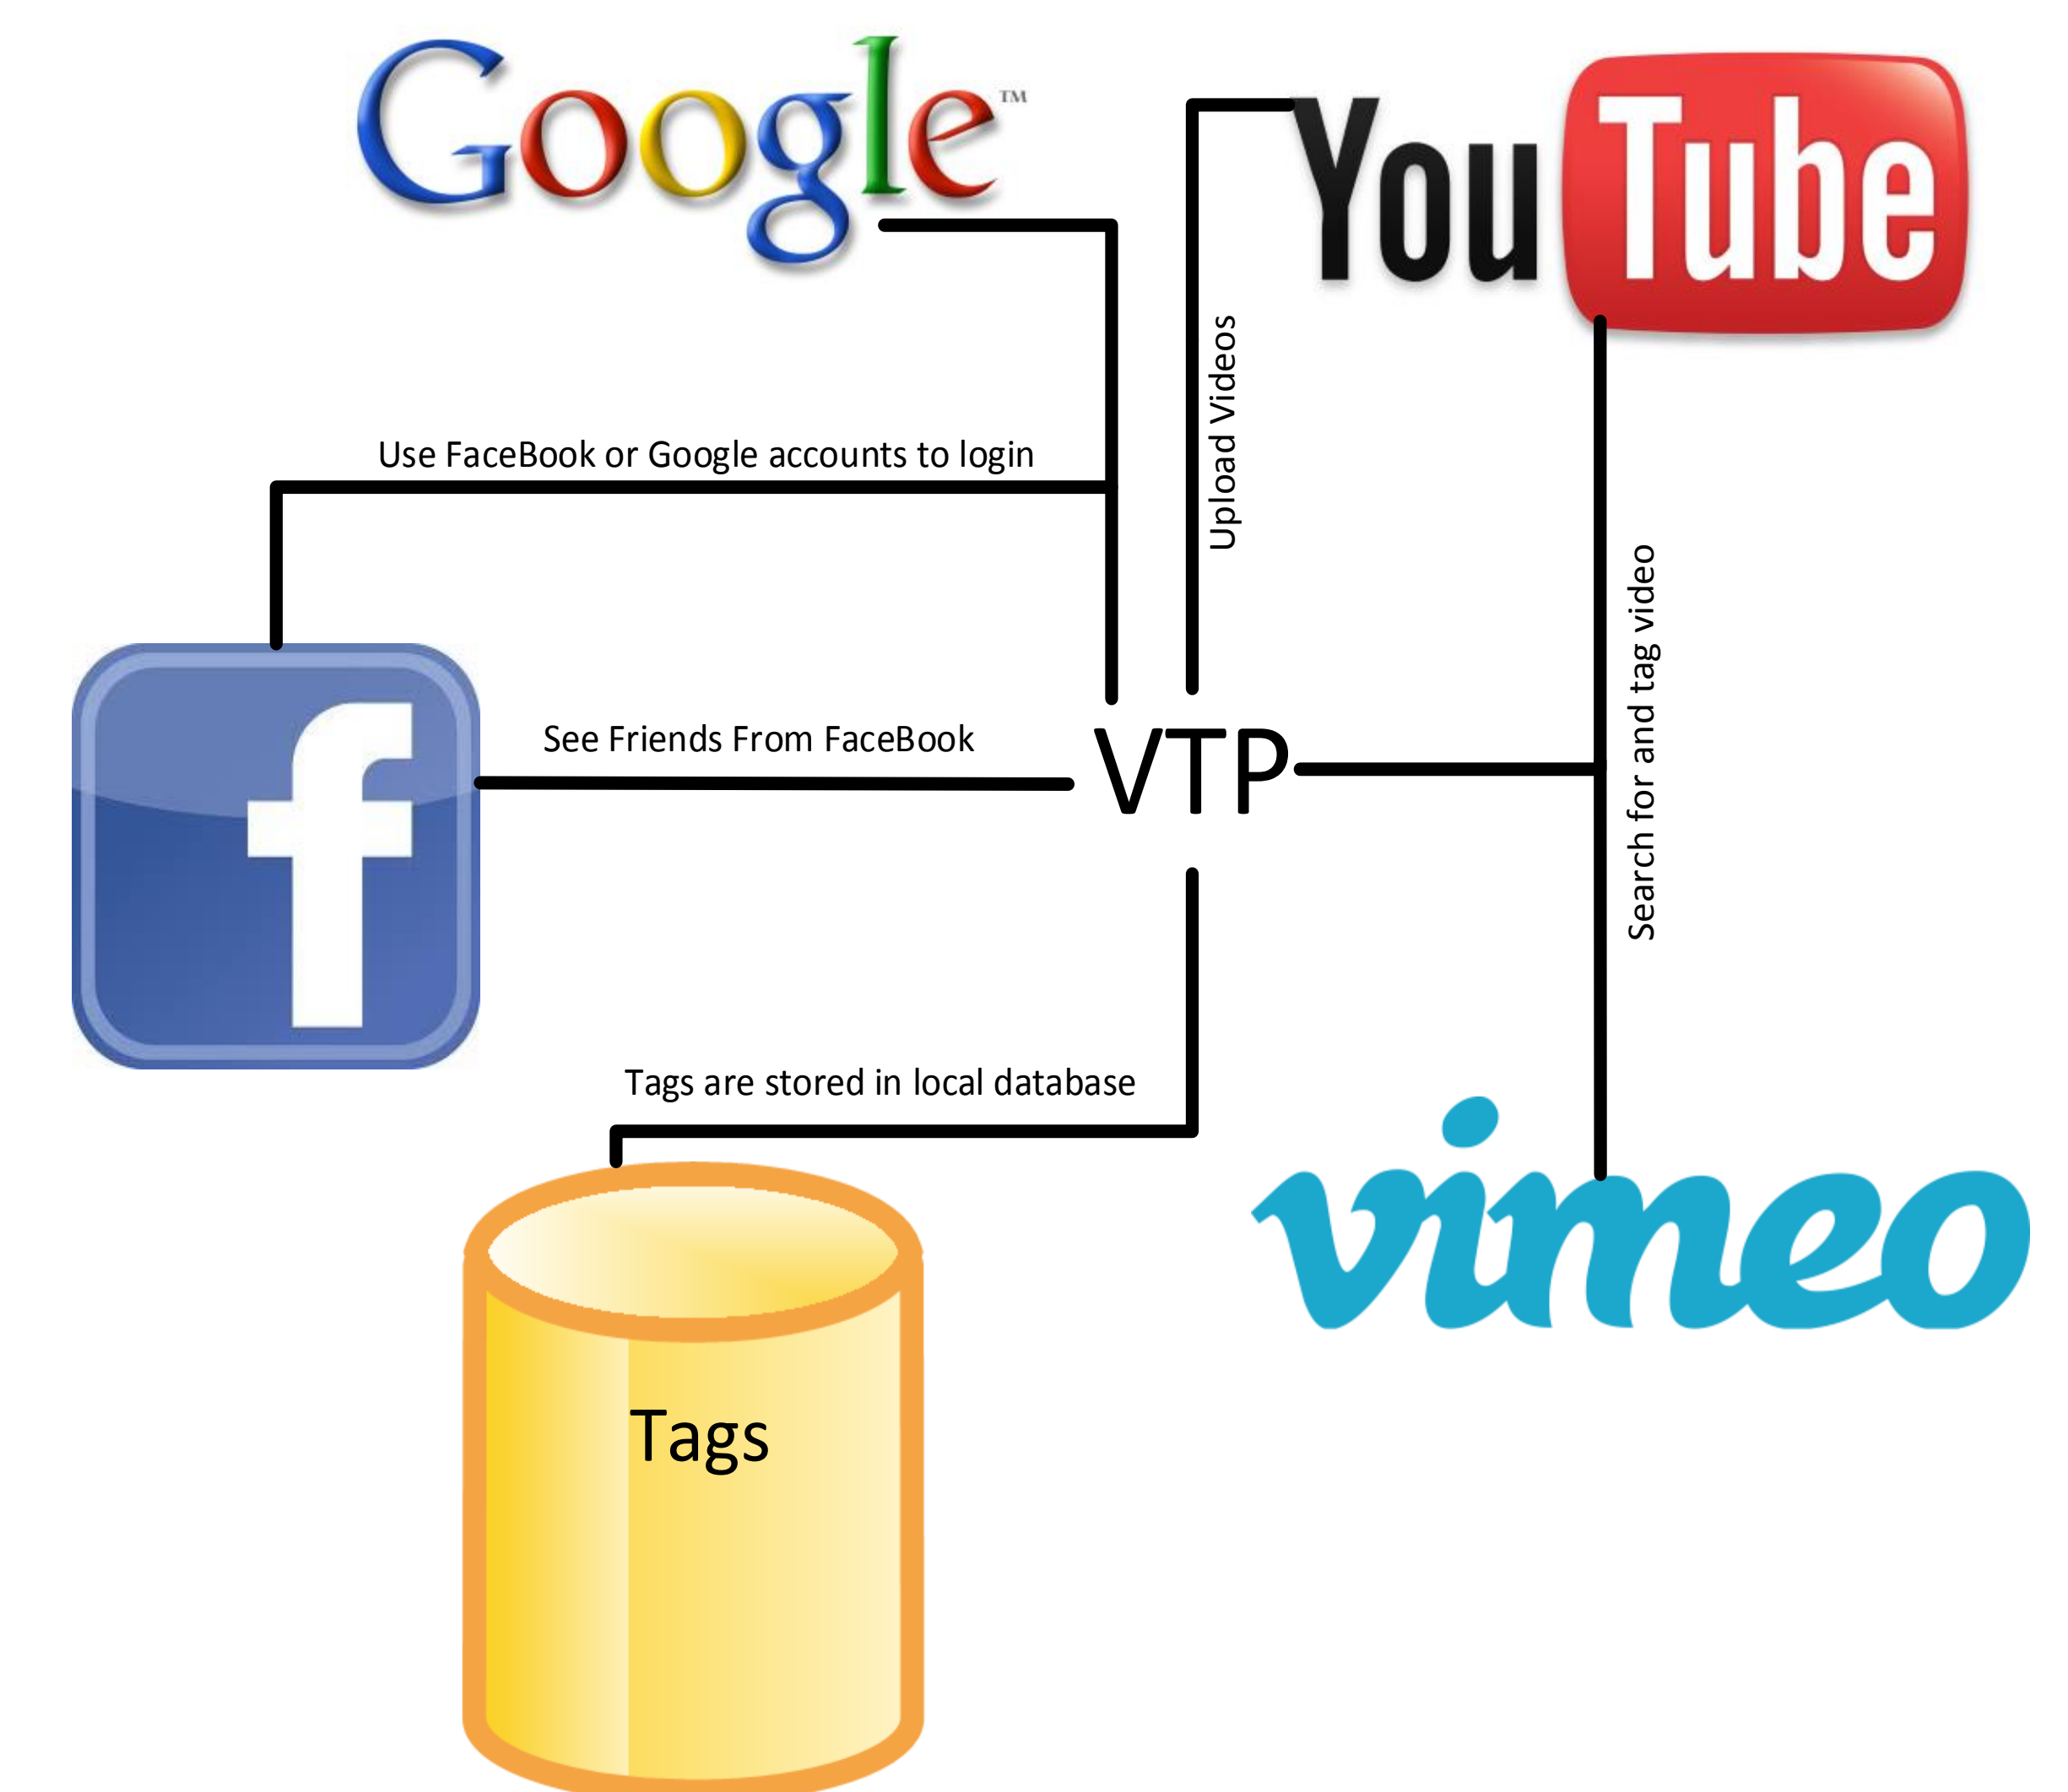

- The idea was originally proposed by Nick Newell from EchoStar.
- Nick noticed that many imaging sites would allow you to add comments and links to still images. However there was no way to easily do this for videos.

## Development Tools

- PHP
- JavaScript
- HTML5
- jQuery
- MySQL
- Popcorn.js
- Google and FaceBook API's
- Notepad++

## How It Works

Using accounts that you already have, you can create videos with tags, upload videos, and see videos that your friends have added to their favorites. The tags are then stored on our local database.
